18章 投资功能

18.1 首页展示

路由: Route::get('/','IndexController@index');

```
use App\Pro;

public function index(){
    $pros = Pro::where('status',1)->take(3)->get();
    return view('index',['pros'=>$pros]);
}
```

view:

```
@foreach($pros as $p)
<div class="pro_bor">
  class="w1">
       预期年化 
       <em class="fs_28">{{$p->rate}}</em>
          <em class="fs_18">%</em>
       class="w2">
       期限
       <em class="fs_18">{{$p->hrange}}</em>个月
     class="w3">
       投资金额 
       {{$p->recive/100}}
     </1i>
     class="w4">
       <span class="b_jingdu b_jd{{sprintf('%d',100 * $p->recive/$p->money)}}">{{sprintf('%.2f',100 * $p->recive/$p->money)}}
     class="w5">
       <a class="btn btnSize_1 btn_orange" href="{{url('pro',[$p->pid])}}">立即投标</a>
     </1i>
  </div>
@endforeach
```

18.2 投标页展示

路由: Route::get('pro/{pid}',"ProController@pro");

控制器:

```
public function pro($pid){
    $pro = Pro::where(['pid'=>$pid,'status'=>1])->first();
    return view('lijitouzi',['pro'=>$pro]);
}
```

view:

```
class="fl td1">
   <h4 class="fc_9 pl_20">产品名称</h4>
     <a href="#" title="{{$pro->title}}">
     {{$pro->title}}
     </a>
     class="fl td2">
   <h4 class="fc_9">借款年利率</h4>
     {{$pro->rate}}%
     class="fl td3">
   <h4 class="fc_9 pl_15">还款期限</h4>
     {{$pro->hrange}}个月
     class="fl td4">
   <h4 class="fc_9">还款方式</h4>
     按月付息 到期还本
  class="fl td5">
   <h4 class="fc_9">投资金额(元)</h4>
     <span class="airal fs_24 fc_orange">
         {{($pro->money - $pro->recive) / 100}}
     </span>元
```

18.3 投资表及迁移文件

投标表:bids

字段	类型	说明
bid	primary	key 主键
uid	integer	用户 uid
pid	integer	项目 pid
title	string	项目名称
money	integer	投标金额
pubtime	integer	投标时间

创建迁移文件: php artisan make:migration create table bids --create=bids

18.4 在线投标

view:

```
//resources/views/lijitouzi.blade.php
<form action="{{url('touzi',[$pro->pid])}}" method="post">
  {!! csrf_field() !!}
投资金额: 
     <input style="width:140px;" class="fc_orange airal fs_18" name="money" value="{{($pro->money - $pro->recive) / 100}}">
  <div class="fc_6 t_r b1 newstyle" style="padding-top:100px;">
<input type="submit" id="confirmBut" value="确认购买" class="btn btnSize_1 btn_orange">
</div>
</form>
```

路由: Route::post('touzi/{pid}',"ProController@touzi");

生成Model: php artisan make:model Bid

```
//按照约定修改
class Bid extends Model
{
    protected $primaryKey = 'bid';
    public $timestamps = false;
}
```

写入数据到投资表:

```
// app/Http/Controllers/ProController.php
use App\Bid;
use Auth;
public function touzi(Request $request , $pid) {
   $pro = Pro::find($pid);
   $bid = new Bid();
   $user = Auth::user();
    if($req->money > ($pro->money-$pro->recive)){
           return "金额不能多于";
   $bid->uid = $user->uid;
   $bid->pid = $pro->pid;
   $bid->title = $pro->title;
   $bid->money = $req->money * 100;
   $bid->pubtime = time();
    $bid->save(); // 写入投资信息
}
```

写入成功,再次修改 touzi方法,

投资的钱,不能大于项目剩余可投的钱,

一旦项目的钱,等于已招标的钱,修改状态为2,还款中,

状态大于1的项目,不能再投钱,停止招标;

```
public function touzi(Request $req ,$pid){
```

```
$pro = Pro::find($pid);
$bid = new Bid();
$user = Auth::user();

$bid->uid = $user->uid;
$bid->pid = $pro->pid;
$bid->title = $pro->title;
$bid->money = $req->money*100;//将用户投资的钱转化成分
$bid->pubtime = time();
$bid->save();//写入投资信息表

$pro->recive += $bid->money;//用户投资的钱我们需要把它写入项目表
$pro->save();

if($pro->recive == $pro->money){
    $this->touziDone($pid);
}
return '购买成功';
}
```

18.5 还款表与收益表

```
protected function touziDone($pro){
    // 1:修改状态为 2 , 还款收益中
    $pro->status = 2;
    $pro->save();

    // 2: 为借款者,生成还款记录

    // 3:为投资者,生成收益记录
}
```

投标完成后,借款人每月要还 "本 + 息",投资人每天要收利息. 因此,我们再建2张表.

还款表:hks

字段	类型	说明
hid	primary	key 主键
uid	integer	用户 uid
pid	integer	项目 pid
title	string	项目名称
amount	integer	每月还款金额
paydate	date	账单日
status	tinyint	是否已还

生成迁移文件:

php artisan make:migration create_table_hks --create=hks

```
//还款表 迁移文件
public function up()
{
    Schema::create('hks', function (Blueprint $table) {
        $table->increments('hid');
        $table->integer('uid');
        $table->integer('pid');
        $table->string('title');
```

```
$table->integer('amount');
$table->date('paydate');
$table->tinyinteger('status');
});
}
```

执行迁移命令: php artisan migrate

18.6 生成月账单

** 为借款者生成还款记录 **

当投资完成的瞬间,由 projects 中的借款金额/借款周期/利率,算出借款人每月几号应还多少钱?

```
protected function touziDone($pid){
   // 1:修改状态为 2 , 还款收益中
$pro=Pro::find($pid);
   $pro->status = 2;
   $pro->save();
   // 2: 为借款者,生成还款记录
   //每月 应还 钱数: (本金 + 利息) 利率按百分比算, 所以 除以100
   mount = (pro-money * pro-rate / 1200) + (pro-money/pro-rate);
   $row = ['uid'=>$pro->uid,'pid'=>$pro->pid,'title'=>$pro->title];
   $row['amount'] = $amount;
   $row['status'] = 0;
   //循环产生每月还款记录
   $today = date('Y-m-d',time()); //今天的日期
   for ($i=1; $i<=$pro->hrange; $i++) {
      $paydate = date('Y-m-d',strtotime("+ $i months")); //下一个月的日期
      $row['paydate'] = $paydate;
      DB::table('hks')->insert($row);
   // 3:为投资者,生成收益记录
}
```

18.7 生成预期收益

投资完成后,生成用户预期收入表,做定时任务, 根据预期收益表 ** 每天 ** 给投资者产生利息收益,写入收益表;

预期收益表 tasks:

字段	类型	说明
tid	primary	key 主键
uid	integer	用户 uid
pid	integer	项目 pid
title	string	项目名称
amount	integer	每天应收的利息
enddate	date	收利息截止日

生成迁移文件: php artisan make:migration create_table_tasks --create=tasks

```
// tasks 表迁移文件
public function up()
```

```
{
    Schema::create('tasks', function (Blueprint $table) {
        $table->increments('tid');
        $table->integer('uid');
        $table->integer('pid');
        $table->string('title');
        $table->integer('amount');
        $table->date('enddate');
    });
}
```

执行迁移命令: php artisan migtate

18.8 生成收益

每天收益表 :grows

字段	类型	说明
gid	primary key	主键
uid	integer	用户 uid
pid	integer	项目 pid
title	string	项目名称
amount	integer	每天的利息
paytime	date	收益日期

```
// grows 表迁移文件
Schema::create('grows', function (Blueprint $table) {
    $table->increments('gid');
    $table->integer('uid');
    $table->integer('pid');
    $table->string('title',60);
    $table->integer('amount');
    $table->date('paytime');
});
```

生成控制器文件: php artisan make:controller GrowController --plain

```
// GrowController.php
public function run() {
```

```
$today = date('Y-m-d'); //先获取今天的日期

//在tasks表中, 只要是大于今天日期的, 都应该得到收益;
$tasks = DB::table('tasks')->where('enddate' , '>=' , $today)->get();

//循环为每个人写入收益信息
foreach($tasks as $t) {
    $t->paytime = $today;
    $t = (array)$t;
    unset($t['tid']);
    unset($t['enddate']);
    DB::table('grows')->insert($t);
}

}
```

添加路由: Route::get('payrun','GrowController@run');

18.9 借款者 还款 账单

```
public function myzd() {
    $user = Auth::user();
    $hks = DB::table('hks')->where('uid',$user->uid)->get();
    return view('myzd' , ['hks'=>$hks]);
}
```

18.10 我的投资

写路由:

```
public function mytz() {
   $user = Auth::user();
   $bids = Bid::where('bids.uid' , $user->uid)->whereIn('status' , [1,2])->join
('projects' , 'bids.pid' , '=' , 'projects.pid')->get(['bids.*' , 'projects.status']);
   //dd($bids);
   return view('mytz' , ['bids'=>$bids]);
}
//view
@foreach($bids as $b)
>
   {{$b->pid}}<span>{{$b->title}}</span>
   {{$b->money/100}}
   {{date('Y/m/d' , $b->pubtime)}}
   @if ($b->status == 1)
      招标中 , 快叫你的朋友来投资
      @elseif ($b->status == 2)
      收益中 , 发了
      @elseif ($b->status == 3)
```

```
    已结束

  @endif

    @endforeach
```

18.11 我的收益

```
public function mysy() {
    $user = Auth::user();
    $grows = DB::table('grows')->where('uid' , $user->uid)->orderBy('gid' , 'desc')->get();
    return view('mysy' , ['grows'=>$grows]);
}
```
